Automotive Machine Learning

Training

Inference

Data *Fuels* Autonomous Vehicles

- Multiple sensors collecting data *every* driving second

Sonar

Cameras

Radar

GPS

Lidar

- Intel[®] reports that autonomous vehicles collect **4,000GB** of data *per day ... each day*

Data sourced from Intel: <https://intel.ly/2fueVli>

Where Does All the Data Go?

- S Sensors**
- Machine Vision
 - LIDAR
 - RADAR
 - SONAR

Vehicles have multiple Engine Control Units (ECUs)

Where Does All the Data Go?

- S Sensors**
- Machine Vision
 - LIDAR
 - RADAR
 - SONAR

Some of these ECUs have local storage but it is scattered.

Edge Computing is Cost Sensitive

Storage is expensive and per ECU storage is inefficient.

NVMe Sharing Technology

Single Root I/O Virtualization (SR-IOV)

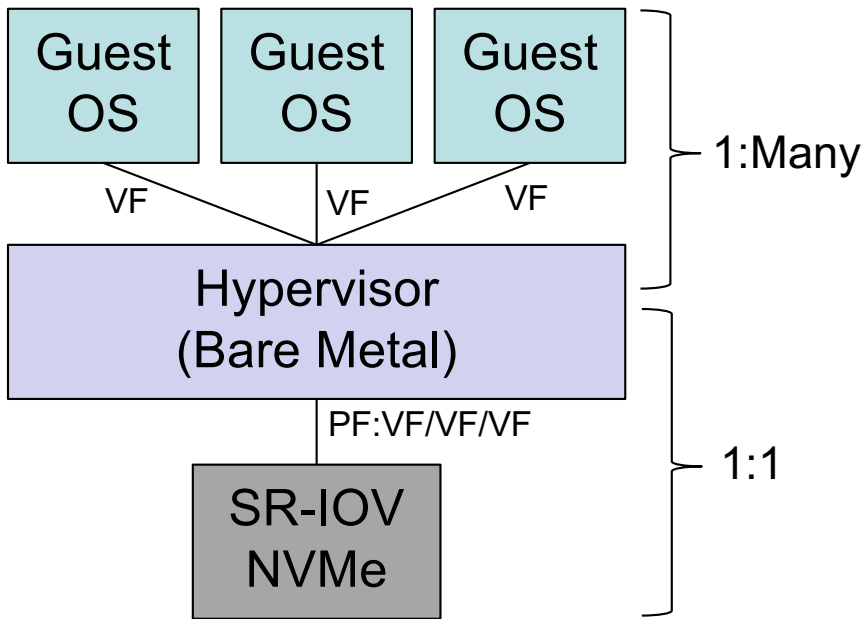

- Originally invented to allow for single endpoints to be exposed as multiple virtual endpoints in a virtual machine environment
- The endpoint is exposed on the PCIe[®] topology as a single physical function (PF) with multiple virtual functions (VF)

NVMe SR-IOV

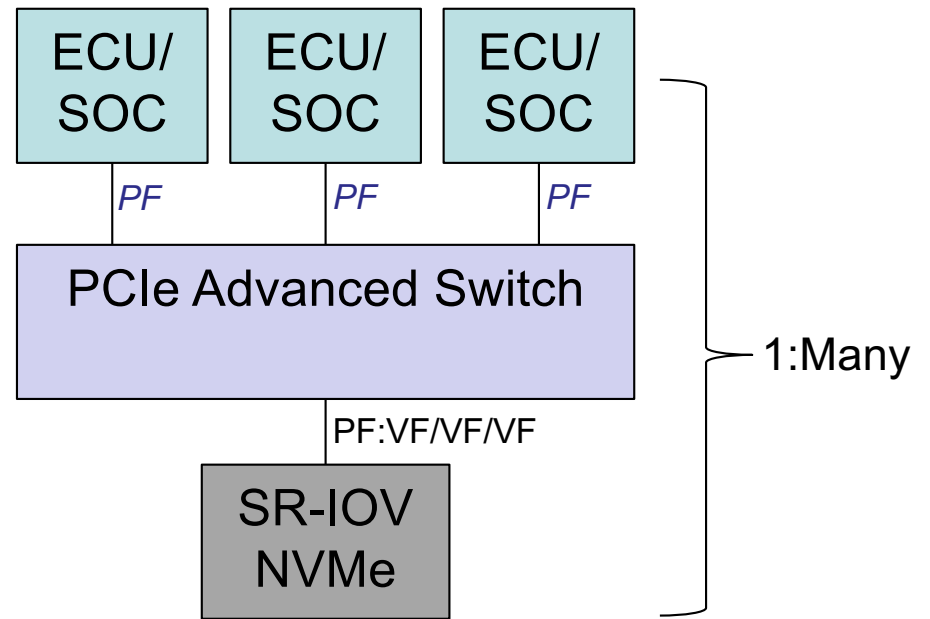

- A fully featured NVMe[™] controller is exposed on each VF as well as on the PF

From Hypervisor to PCIe Shared

Classic NVMe SR-IOV

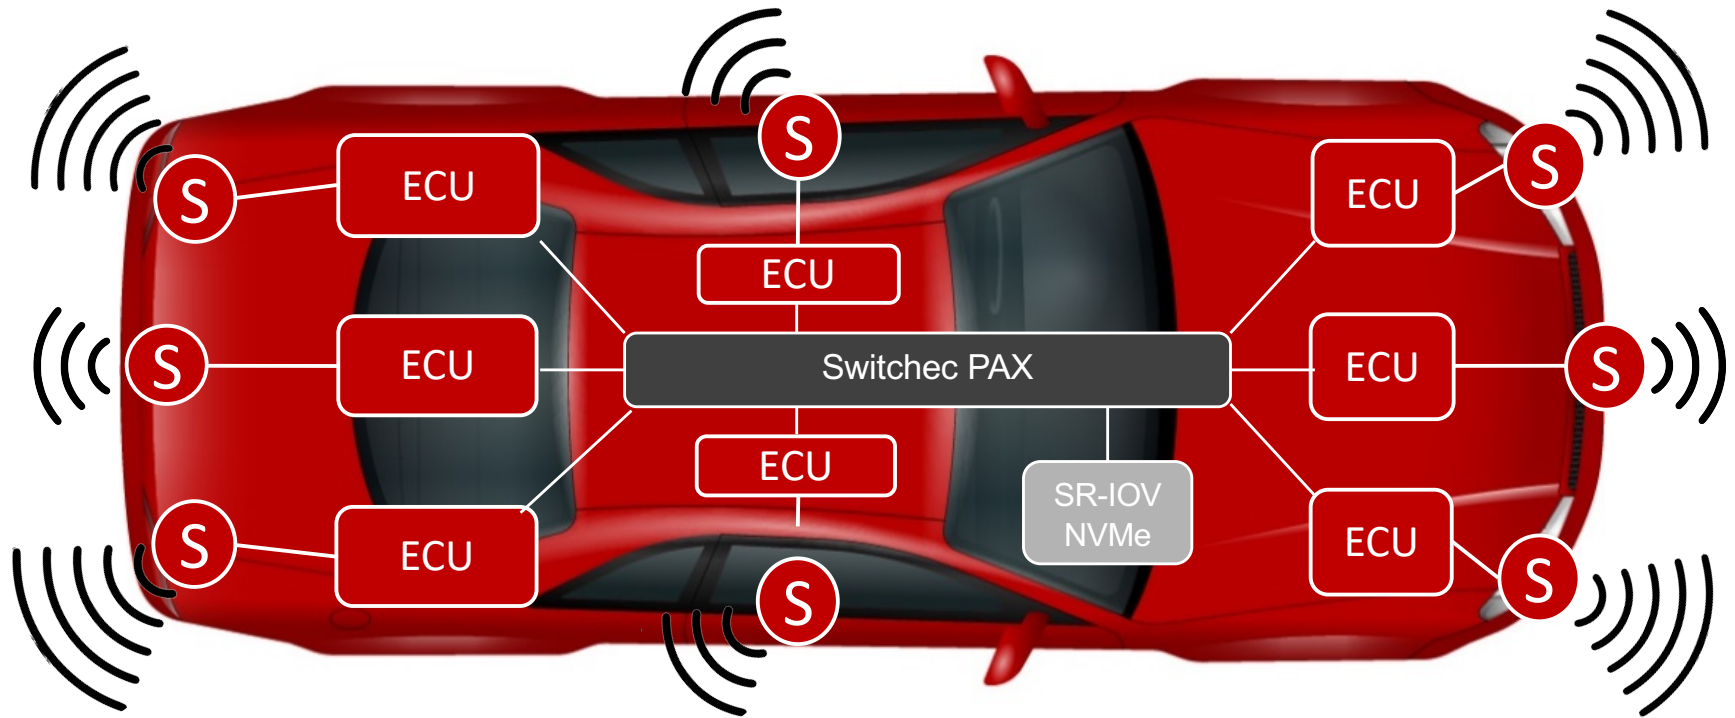

Automotive NVMe SR-IOV

SR-IOV NVMe Sharing with PAX

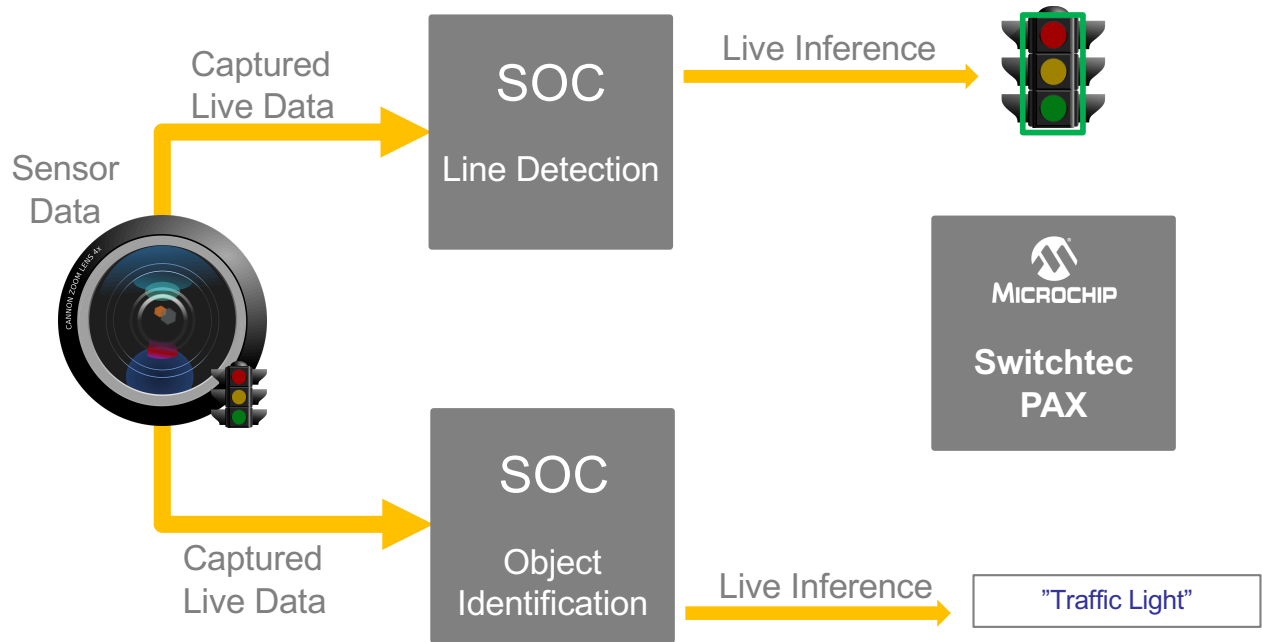

Autonomous Vehicle at Rest

Step 1: Models are downloaded from data center

Autonomous Vehicle Active

Step 2: Machine inference is performed on live data

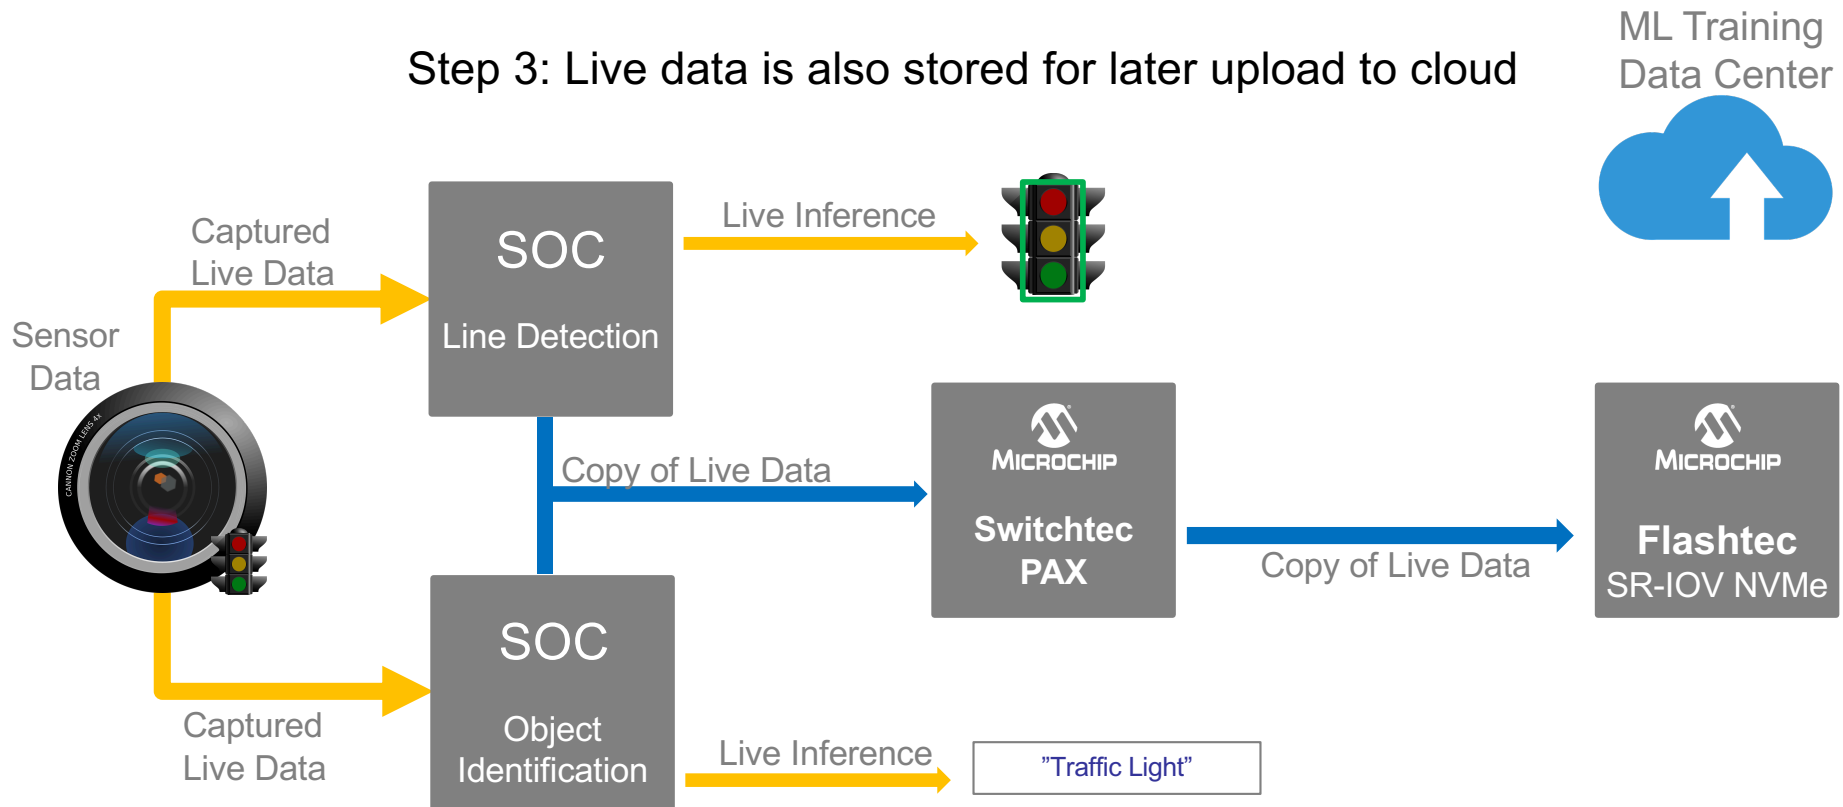

ML Training
Data Center

Autonomous Vehicle Active

Step 3: Live data is also stored for later upload to cloud

Autonomous Vehicle at Rest

Step 4: Stored raw data is uploaded for further training

Sensor Data

SOC
Line Detection

Object Identification

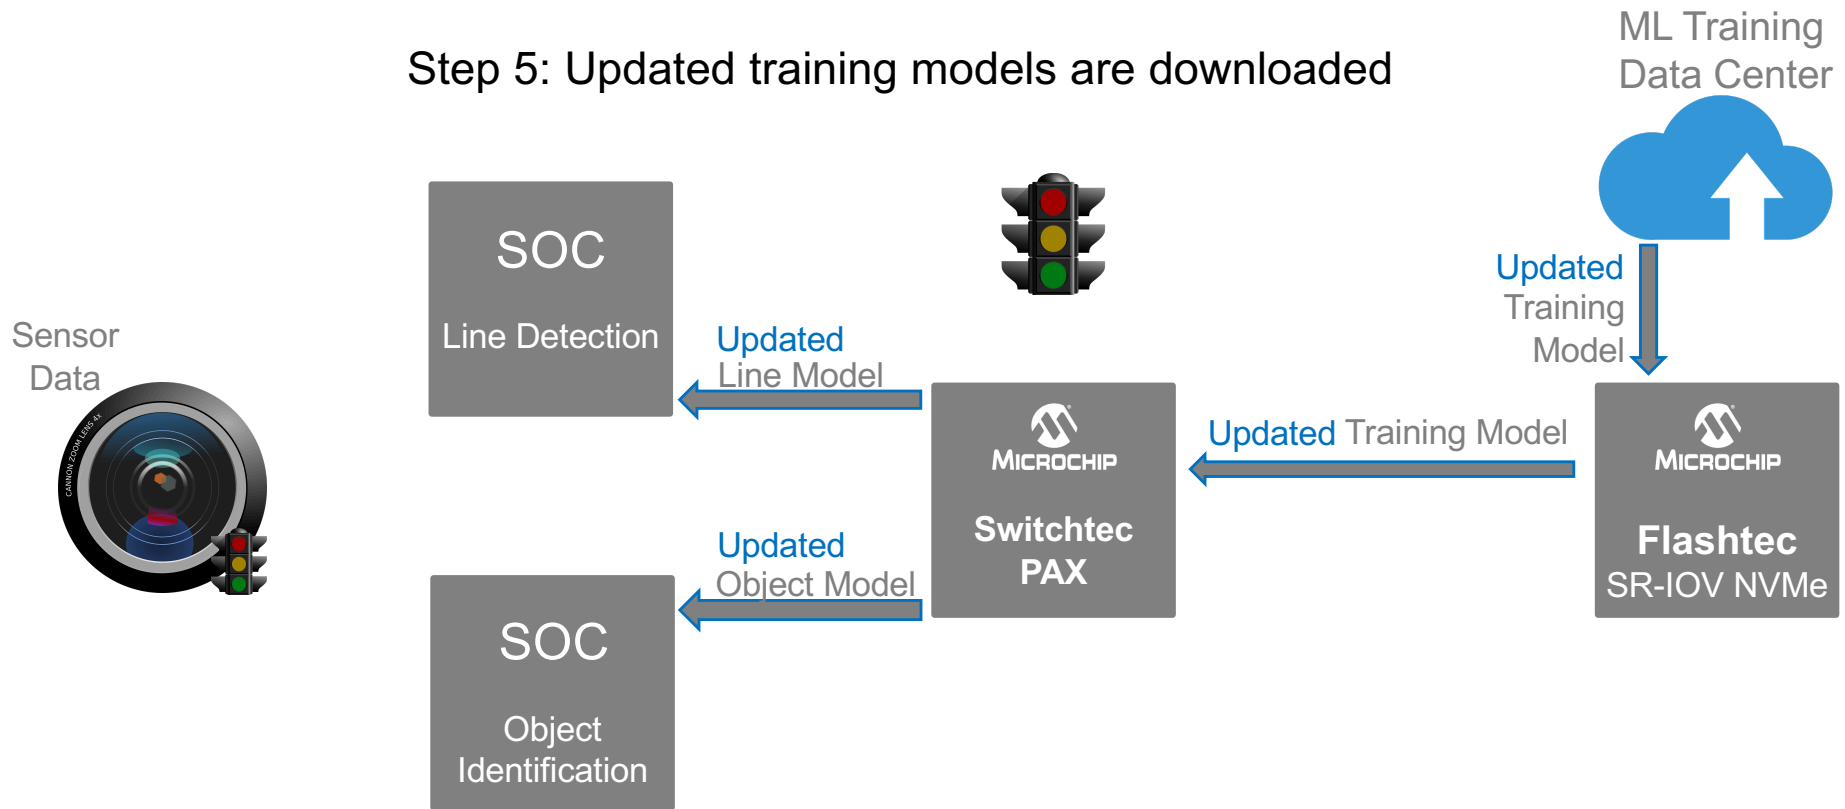

MICROCHIP
Switchtec
PAX

Autonomous Vehicle at Rest

Step 5: Updated training models are downloaded

Flash Memory Summit

Summary

- Vehicles are getting more complex
- Data is fueling autonomous vehicles
 - Currently scattered over several storage elements
- SR-IOV NVMe sharing can be a cost-effective way to implement edge computing in the autonomous vehicle
